Agentforce Vibes Walkthrough

8 minutes

> ⚠️ **Stop — check you're in a sandbox**
>
> Before you make any changes, confirm the org you're logged into is your **fullcopy sandbox**, not production. Check the org name in the top-right user menu.

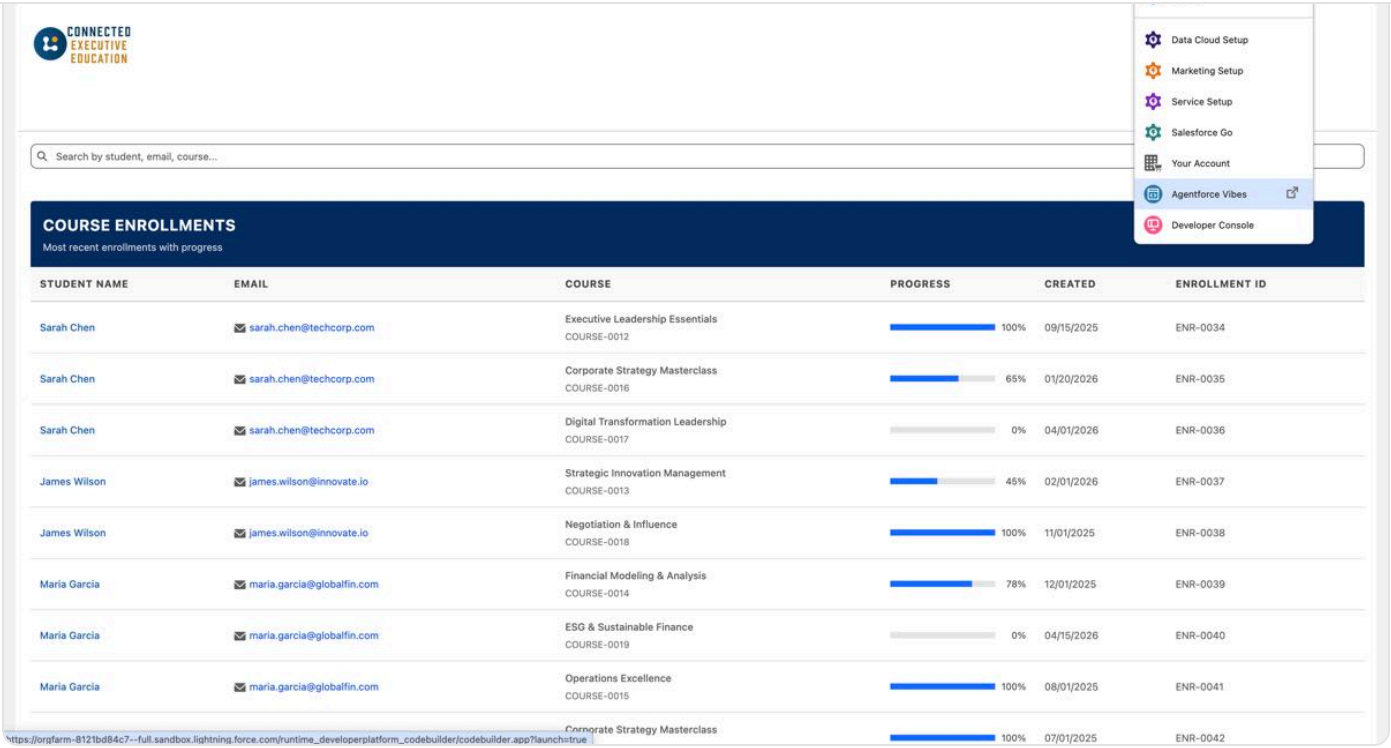

Agentforce Vibes is a browser-based AI-powered IDE built directly into Salesforce. It always starts in a sandbox, so your data is already masked and no PII ever reaches the developer. There's nothing to install and nothing to configure.

Open Agentforce Vibes

1. Launch from the Setup Menu

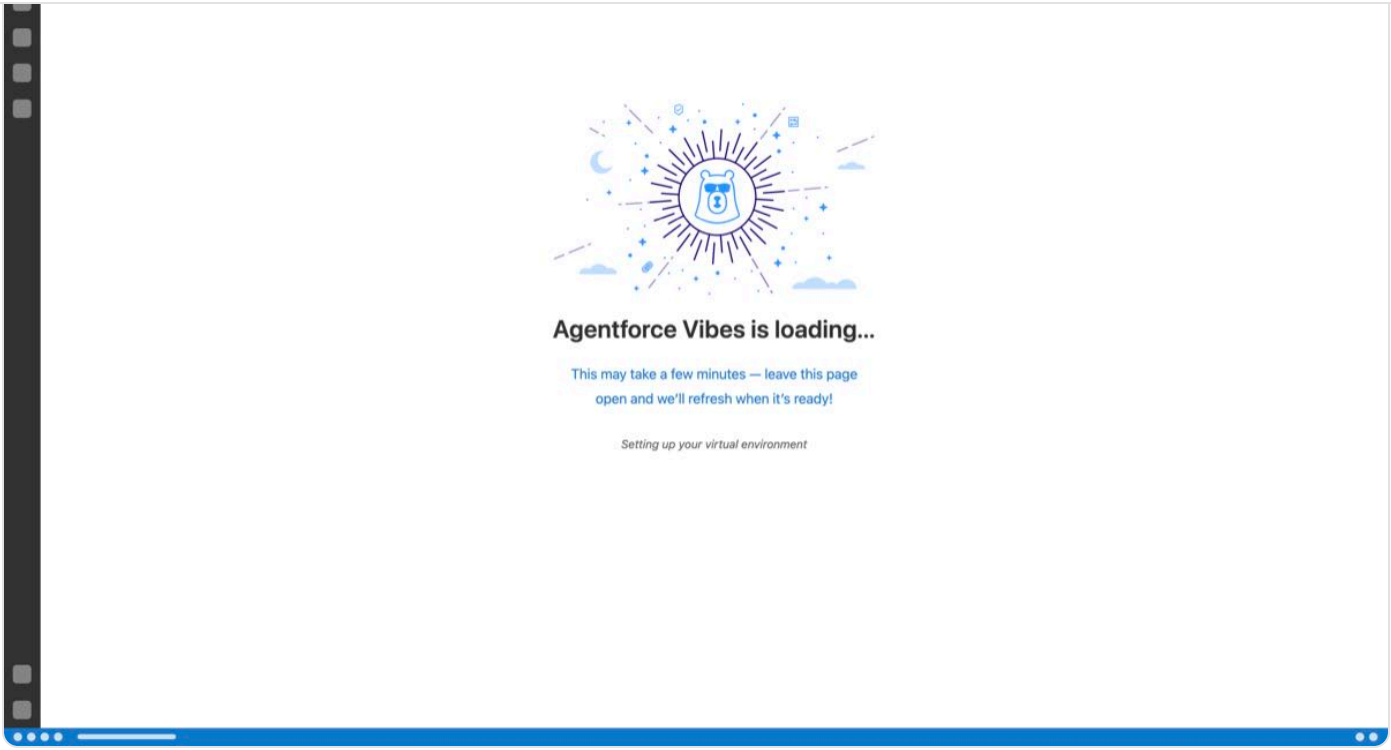

In your sandbox, click the **gear icon** in the top right to open the Setup Menu. You'll see **Agentforce Vibes** listed with an external link icon. Click it to launch.

Agent & App Development Workshop

2. Wait for the environment to load

Agentforce Vibes will set up your virtual environment. This may take a few minutes on first launch — leave the page open and it will refresh when it's ready.

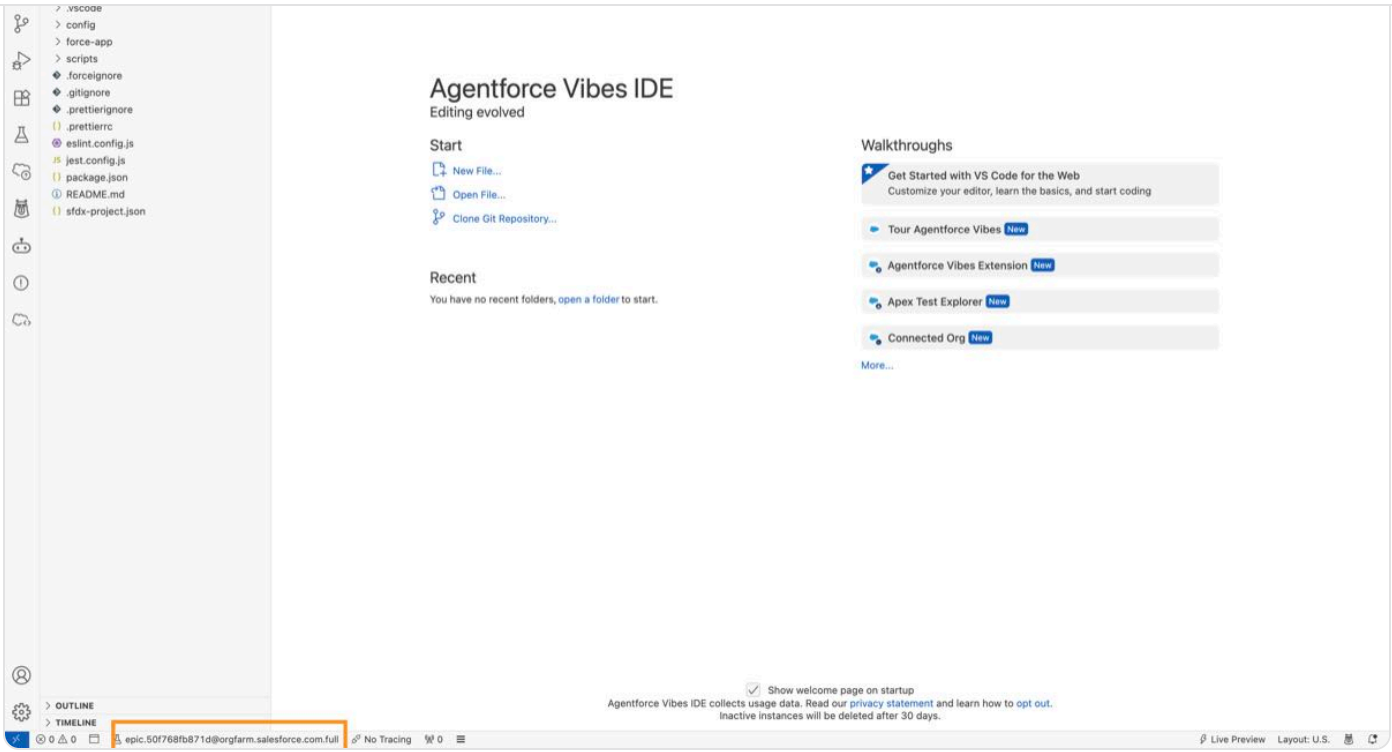

The IDE

3. Welcome page and file explorer

Once loaded, you'll see the **Agentforce Vibes IDE** welcome page. The left panel shows the **Explorer** with your `dx-project` — this is the Salesforce DX project structure you will work with. Notice that it is automatically connected to the sandbox. If you don't see the Explorer panel, click the file icon in the top of the left activity bar to open it.

Agent & App Development Workshop

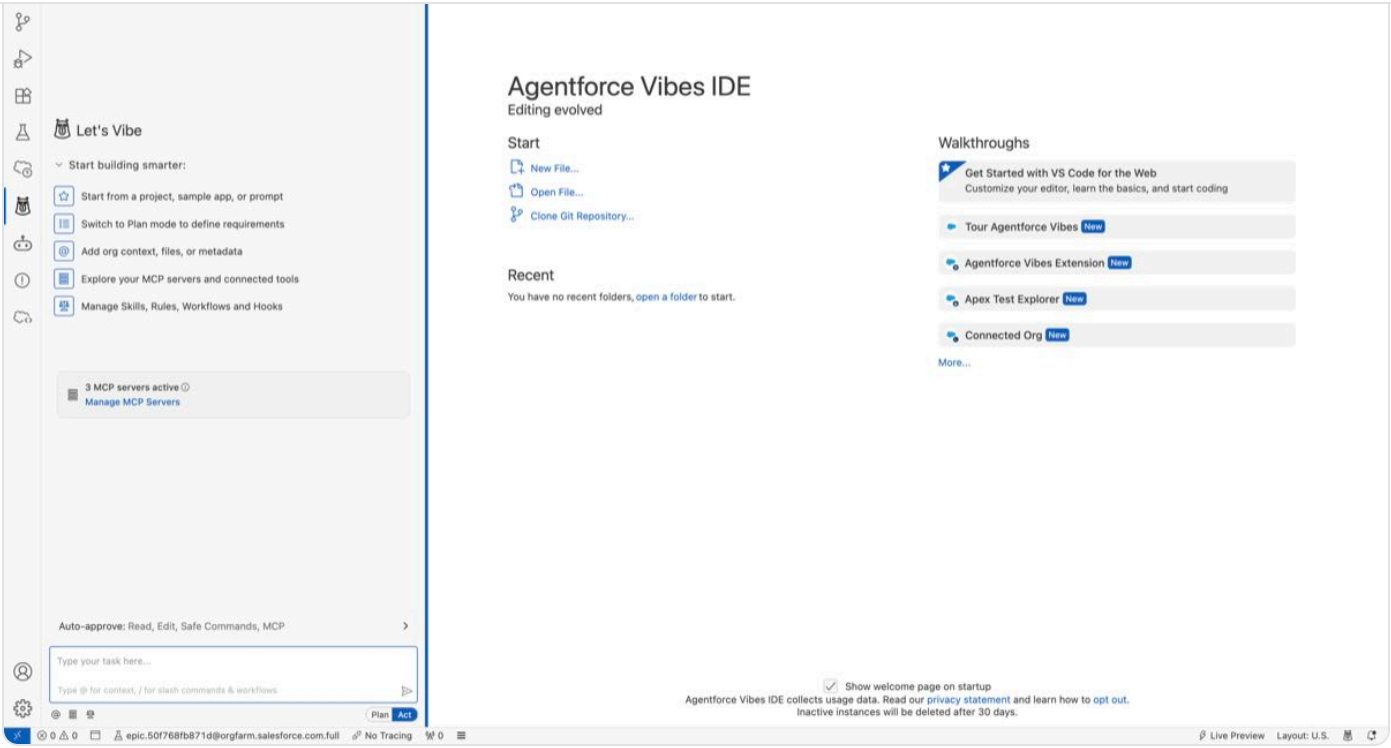

4. The "Let's Vibe" sidebar

Click the **Agentforce Vibes** icon in the left activity bar to open the **Let's Vibe** sidebar. You may be prompted to enable Agentforce Vibes — click **Enable** to proceed. This is your starting point for working with the AI agent.

At the bottom of the sidebar, notice the **Plan** and **Act** mode toggles and the prompt input where you'll type your tasks.

Agent & App Development Workshop

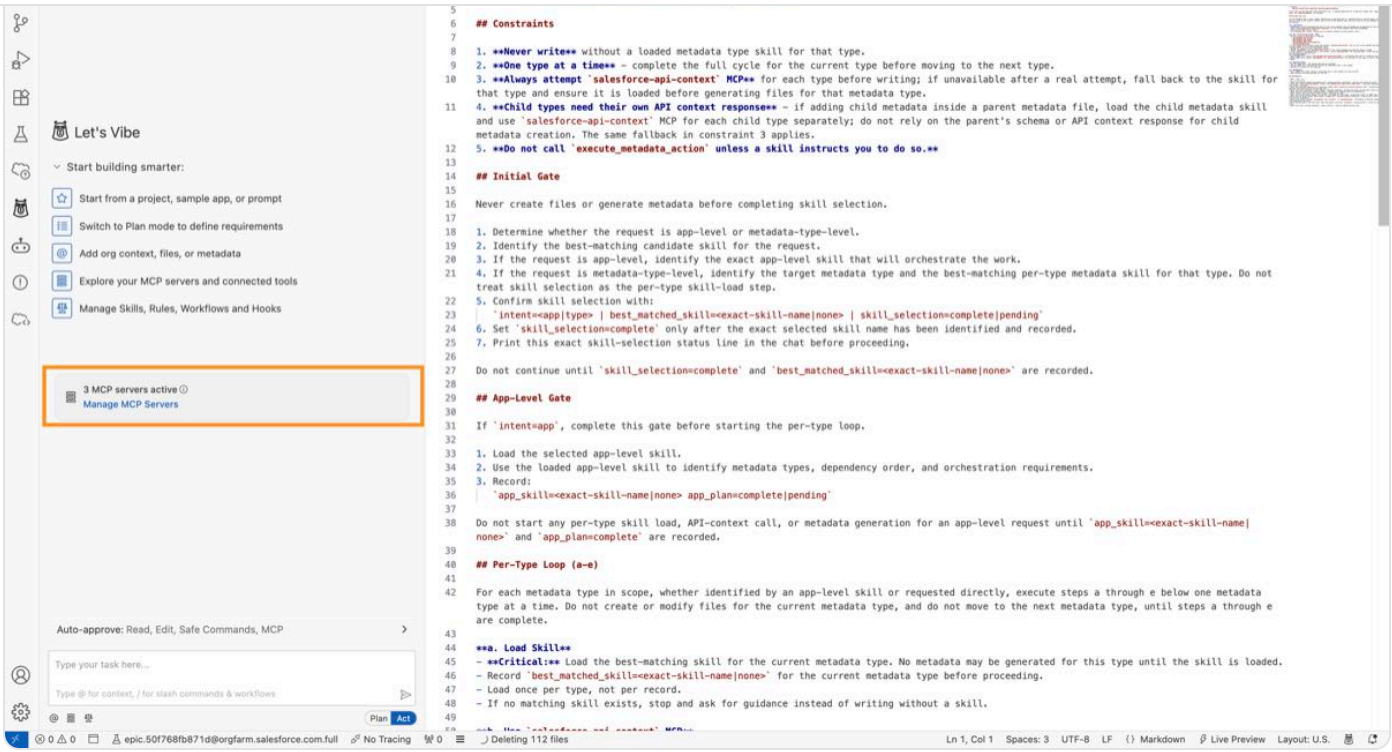

MCP Servers

5. Connected MCP servers

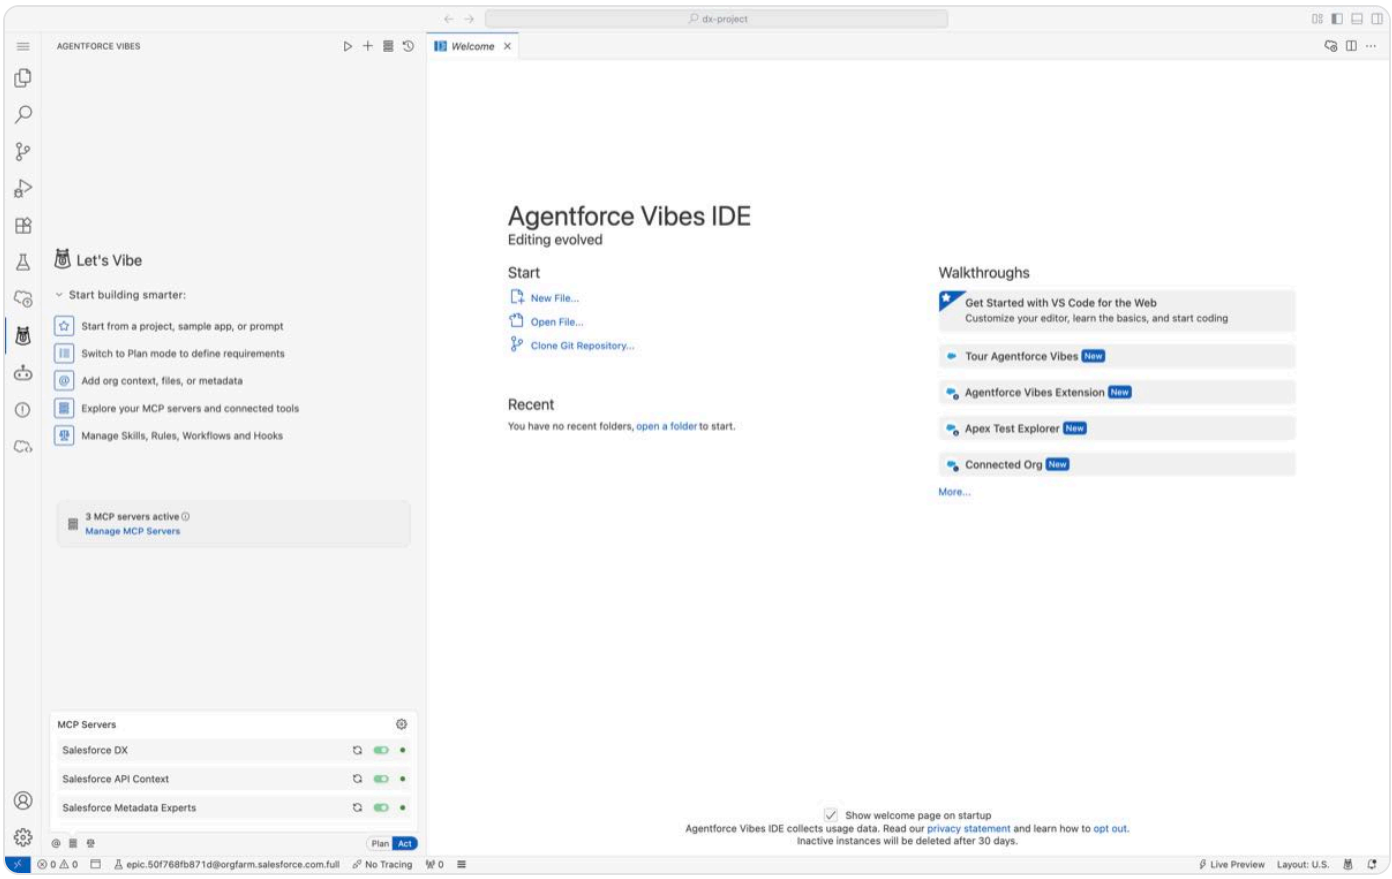

Click **Manage MCP Servers** from the Let's Vibe sidebar to expand the panel and see all three connected servers:

- **Salesforce DX** — access to org metadata, deployment, and source tracking
- **Salesforce API Context** — understands your org's API structure and data model
- **Salesforce Metadata Experts** — discovers and resolves metadata types and dependencies

Agent & App Development Workshop

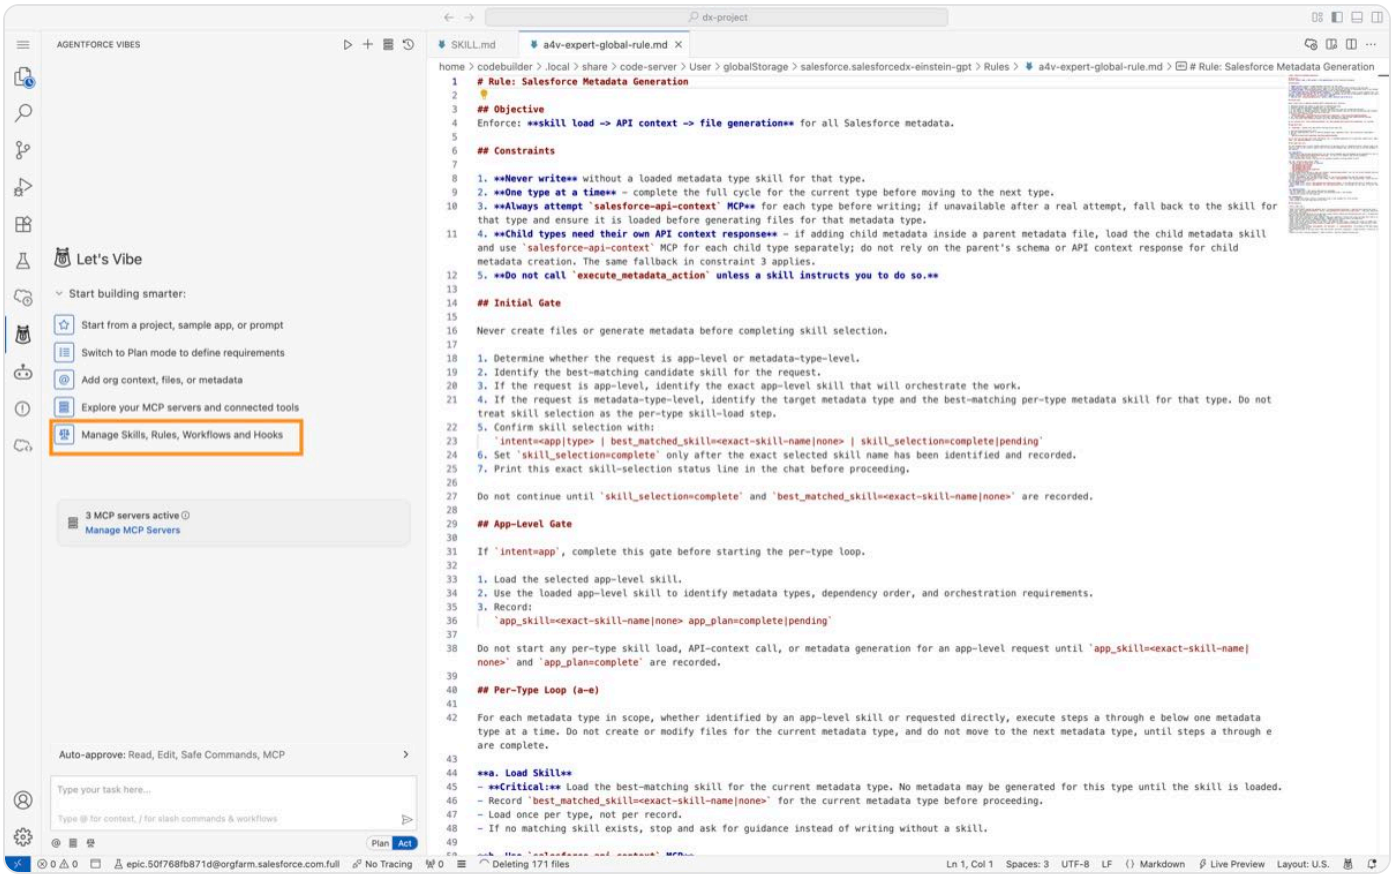

Each server shows a green dot indicating it's active. Through these MCP servers, the agent knows your custom objects and your business logic. It doesn't guess your schema — it reads it.

Agent & App Development Workshop

6. What the agent can do

Click the **Skills** tab in the sidebar to see the list of available skills. Skills define **what the agent can do** — the actions it can take and the systems it can interact with.

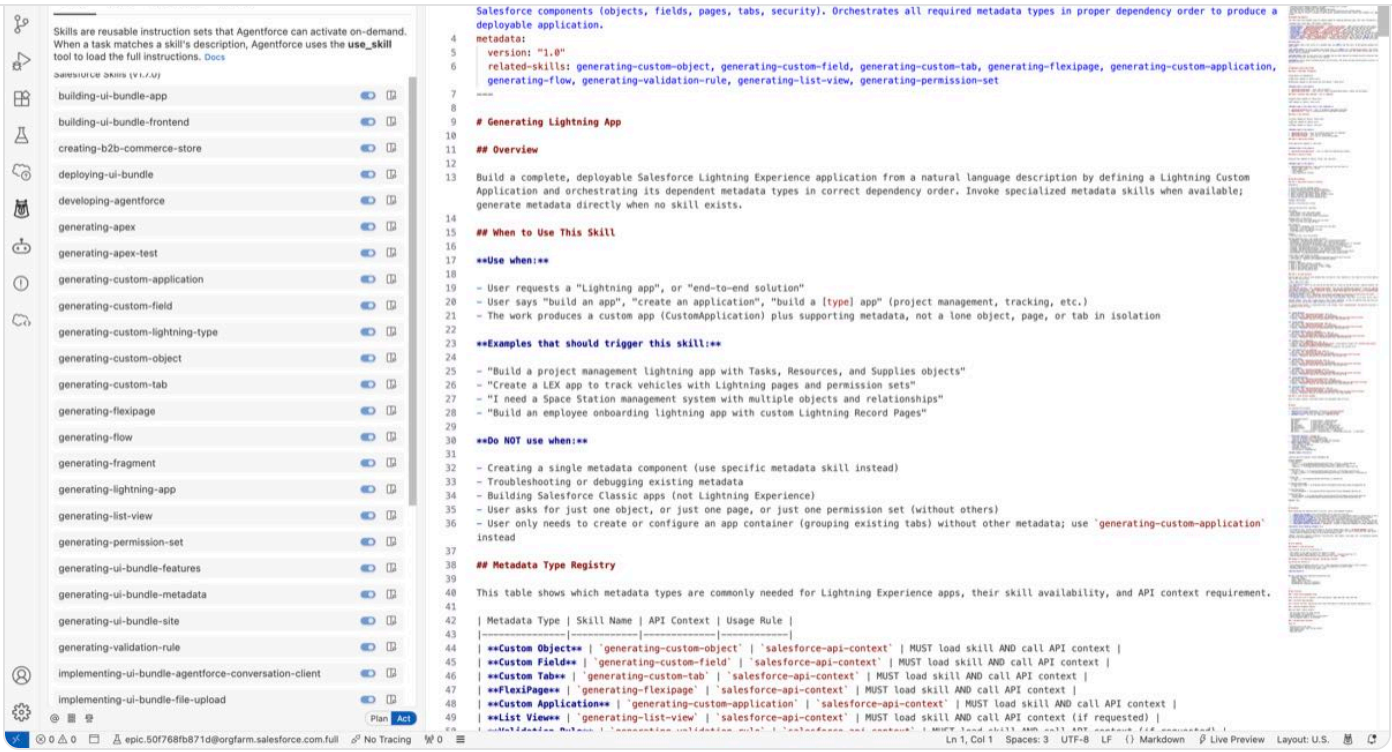

Salesforce ships out-of-the-box skills built on years of platform best practices, including:

- `generating-lightning-app` — build complete Lightning Experience applications
- `generating-apex` — create Apex classes and triggers
- `generating-custom-object` — scaffold custom objects and fields
- `generating-custom-tab` — create custom tabs for your app
- `generating-permission-set` — define permissions and access

You can click any skill to view its `SKILL.md` file, which describes when and how the agent uses that skill.

Agent & App Development Workshop

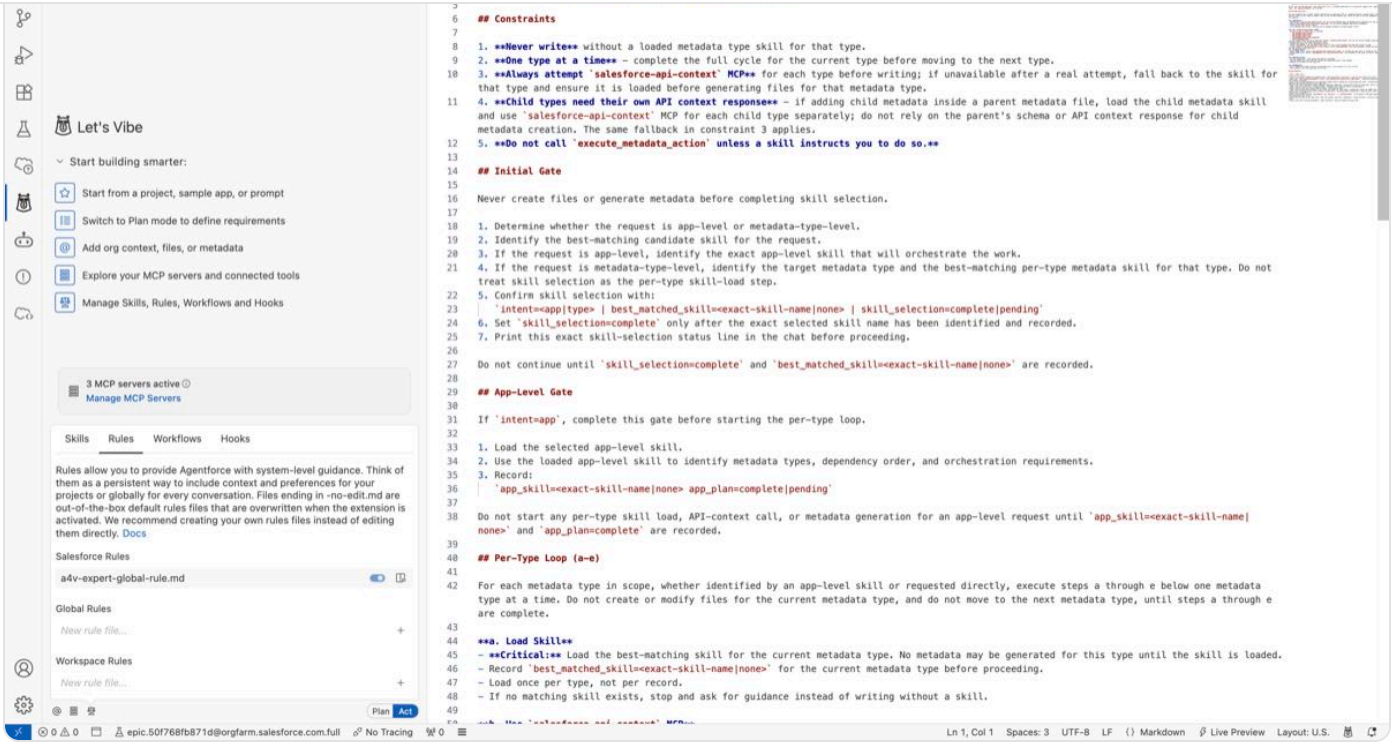

Rules

7. How the agent behaves

Click the **Rules** tab to see the governance guardrails. Rules define **how the agent behaves** — the boundaries around security, data access, and best practices.

Salesforce provides out-of-the-box rules like `a4v-expert-global-rule.md` that ensure every interaction operates inside a defined, governed system. These rules enforce standards around code quality, security patterns, and Salesforce platform conventions.

Metadata Explorer

8. Retrieve org metadata

In the prompt input at the bottom, type the following prompt:

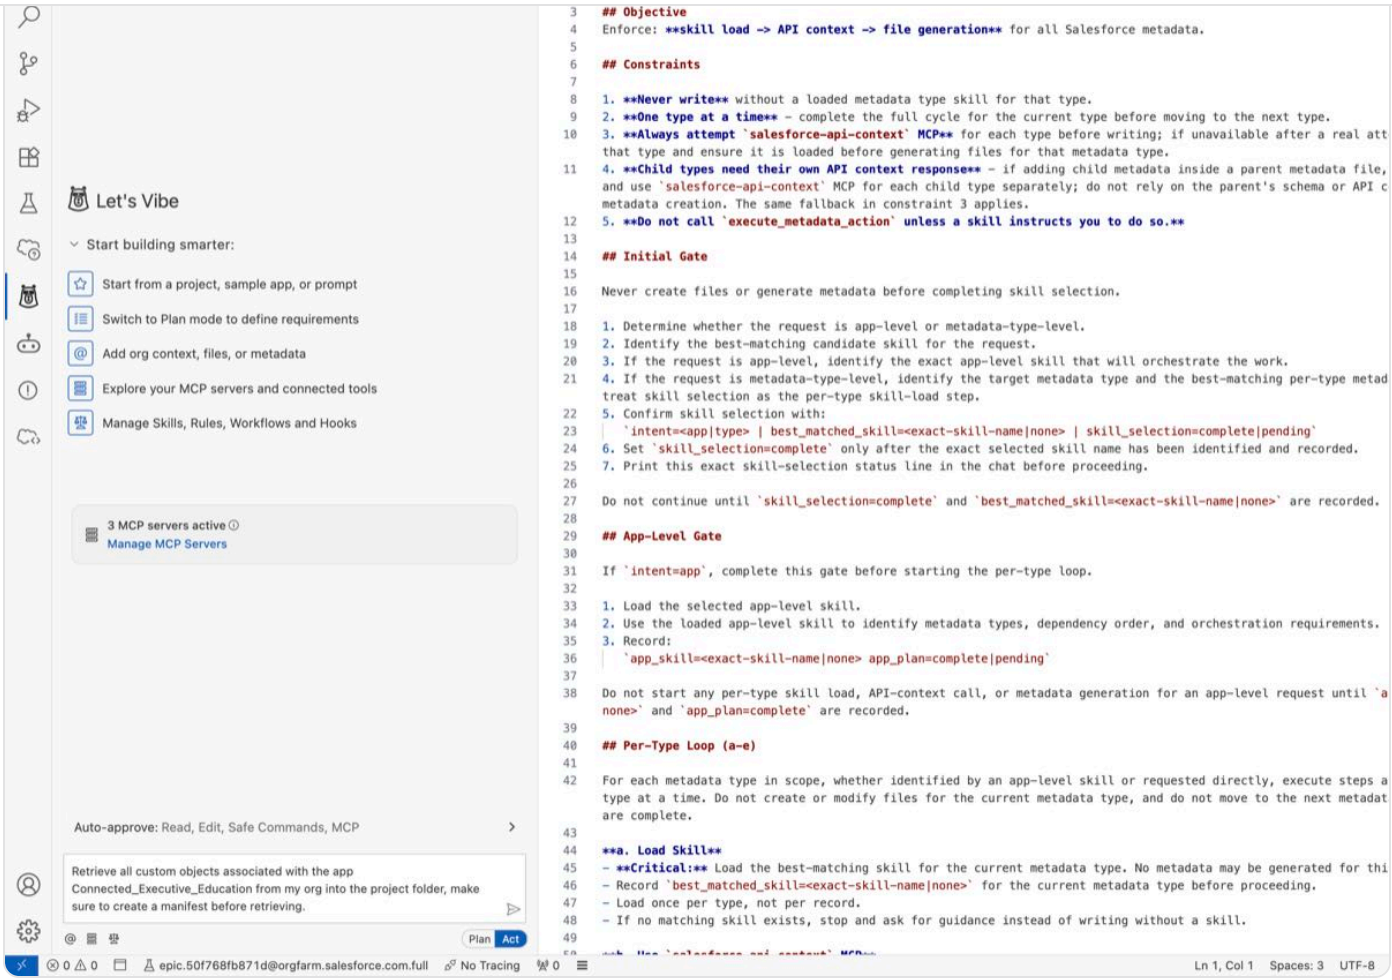

```
Retrieve all custom objects associated with the app
Connected_Executive_Education from my org into the project folder, make sure to
create a manifest before retrieving.
```

Copy

Agentforce Vibes will create a manifest file and retrieve the metadata from your sandbox into the project folder.

> **Approve requests to proceed**
>
> Agentforce Vibes will ask for permission before executing actions. You can approve each request to let it proceed. If prompted to choose an org, select the **default** option.

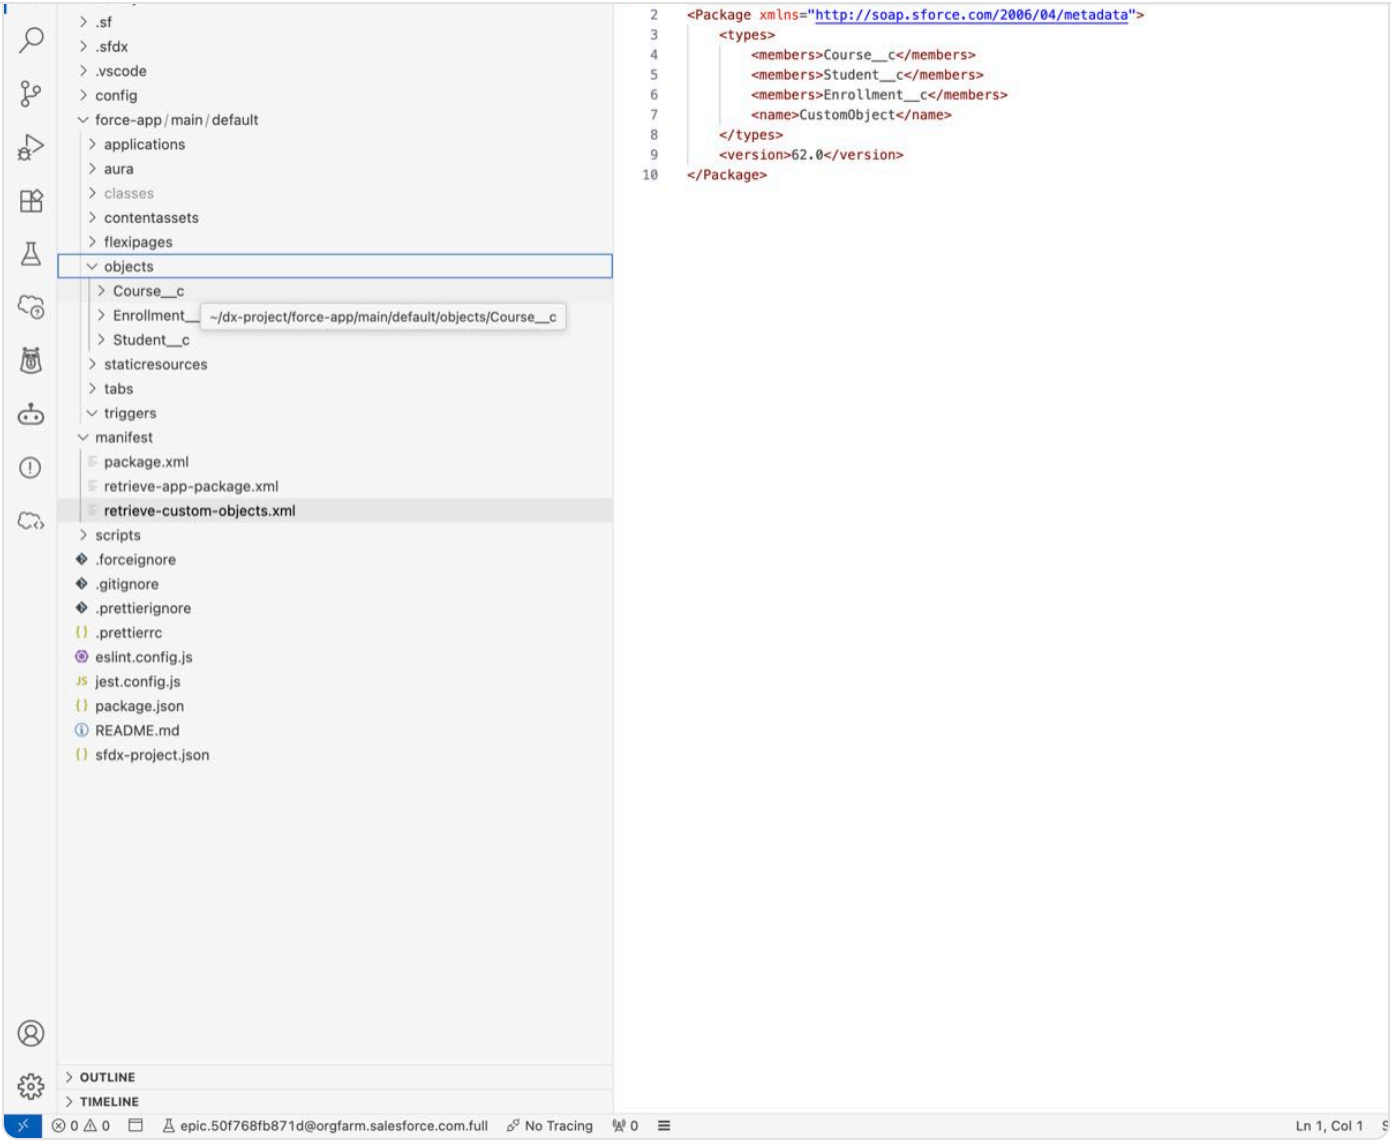

Agent & App Development Workshop

9. Explore objects and fields

In the Explorer, expand **force-app > main > default > objects** to see the three custom objects: **Course__c**, **Enrollment__c**, and **Student__c**. Expand any object to browse its fields.

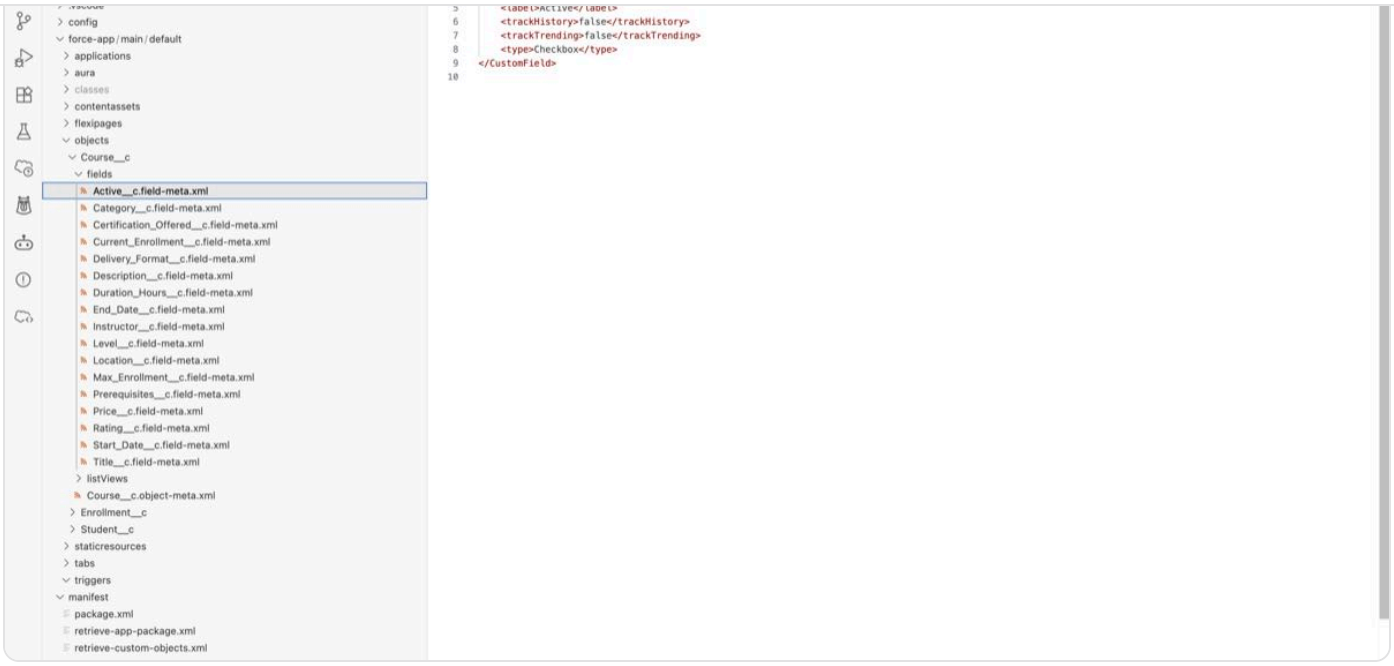

Agent & App Development Workshop

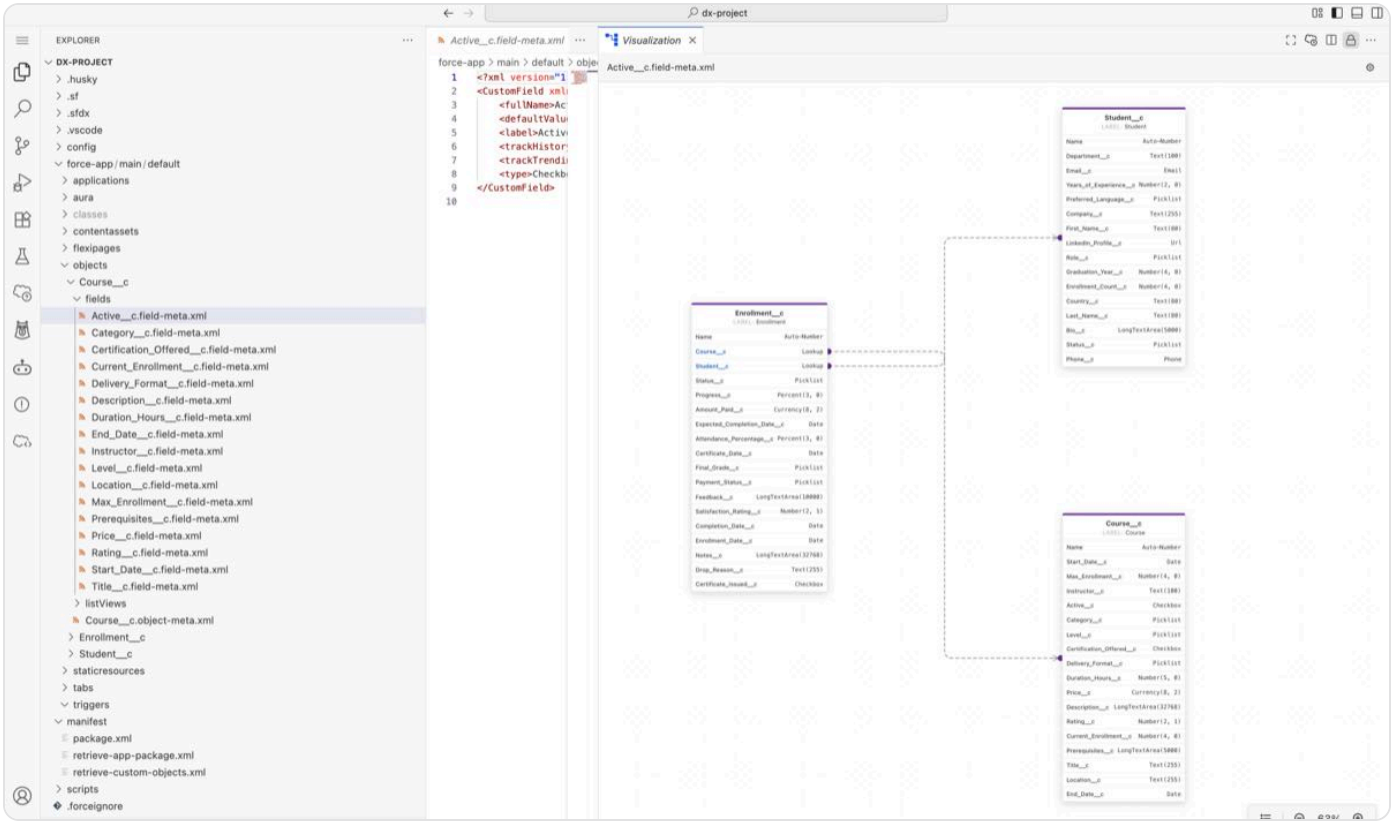

10. Visualize the schema

Click on any field file to open it in the editor. Then click the **Visualize** button in the top right to see a visual representation of your custom objects and their relationships.

Agent & App Development Workshop

You can see how **Enrollment__c** connects to both **Student__c** and **Course__c** through lookup fields, along with every field and its data type.

> ### Governed by design
>
> Every interaction in Agentforce Vibes operates inside a governed system. Skills define what the agent can do. Rules define how it behaves. MCP servers connect it to your org metadata. And
