Build the Leaderboard

7 minutes

Now it's time to build. You'll give Agentforce Vibes a natural language prompt along with the dashboard screenshot you saved earlier, and it will retrieve the existing code, generate new components, and create tests for you.

Submit the prompt

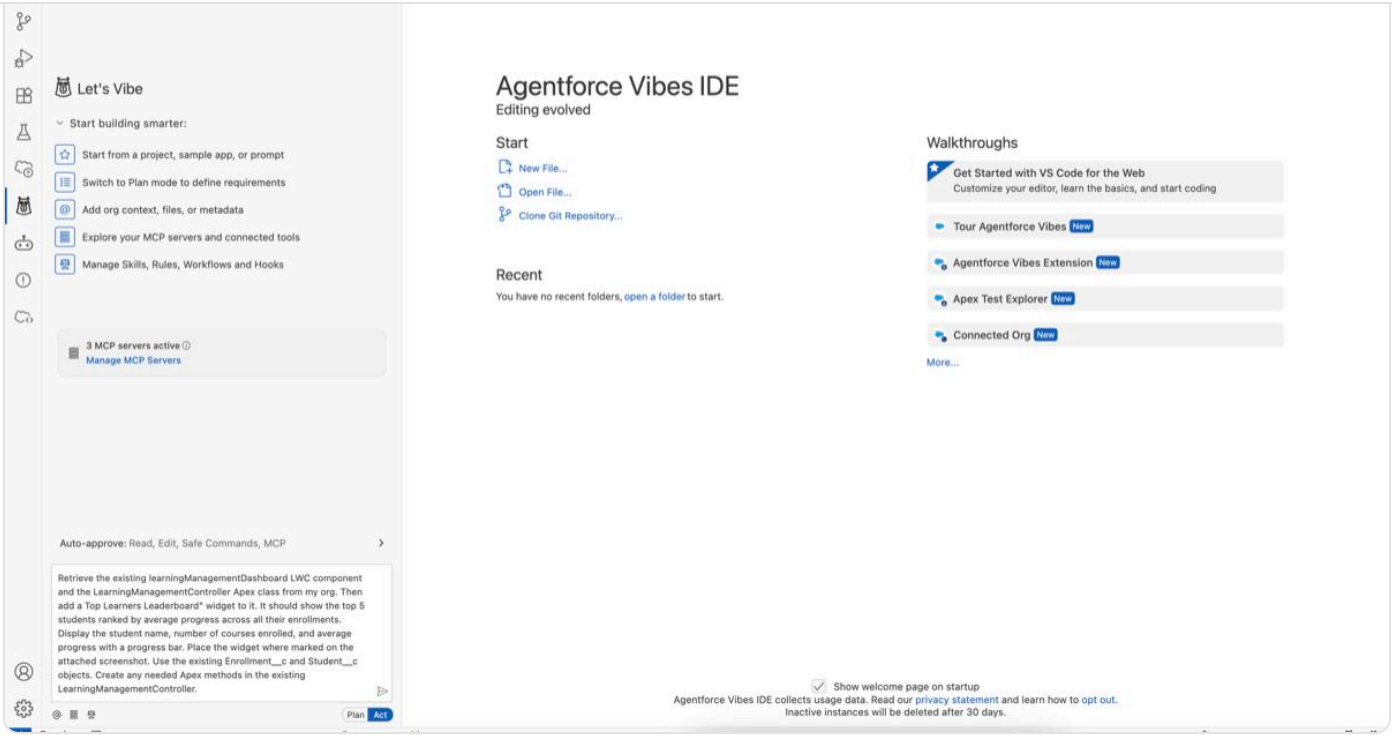

1. Attach the dashboard screenshot and submit the prompt

First, find the dashboard screenshot you saved in Step 1 (the one with the orange arrow) in Finder (Mac) or File Explorer (Windows) and copy it (**Cmd + C** on Mac, **Ctrl + C** on Windows). Then click into the prompt input in Agentforce Vibes and paste it (**Cmd + V** / **Ctrl + V**). You should see the image attached to the conversation. Then type the following prompt:

```
Retrieve the existing learningManagementDashboard LWC component and the
LearningManagementController Apex class from my org. Then add a "Top Learners
Leaderboard" widget to it. It should show the top 5 students ranked by average
progress across all their enrollments. Display the student name, number of
courses enrolled, and average progress with a progress bar. Place the widget
where marked on the attached screenshot. Use the existing Enrollment__c and
Student__c objects. Create any needed Apex methods in the existing
LearningManagementController.
```

Copy

Agent & App Development Workshop

Watch it build

2. Agentforce generates the code

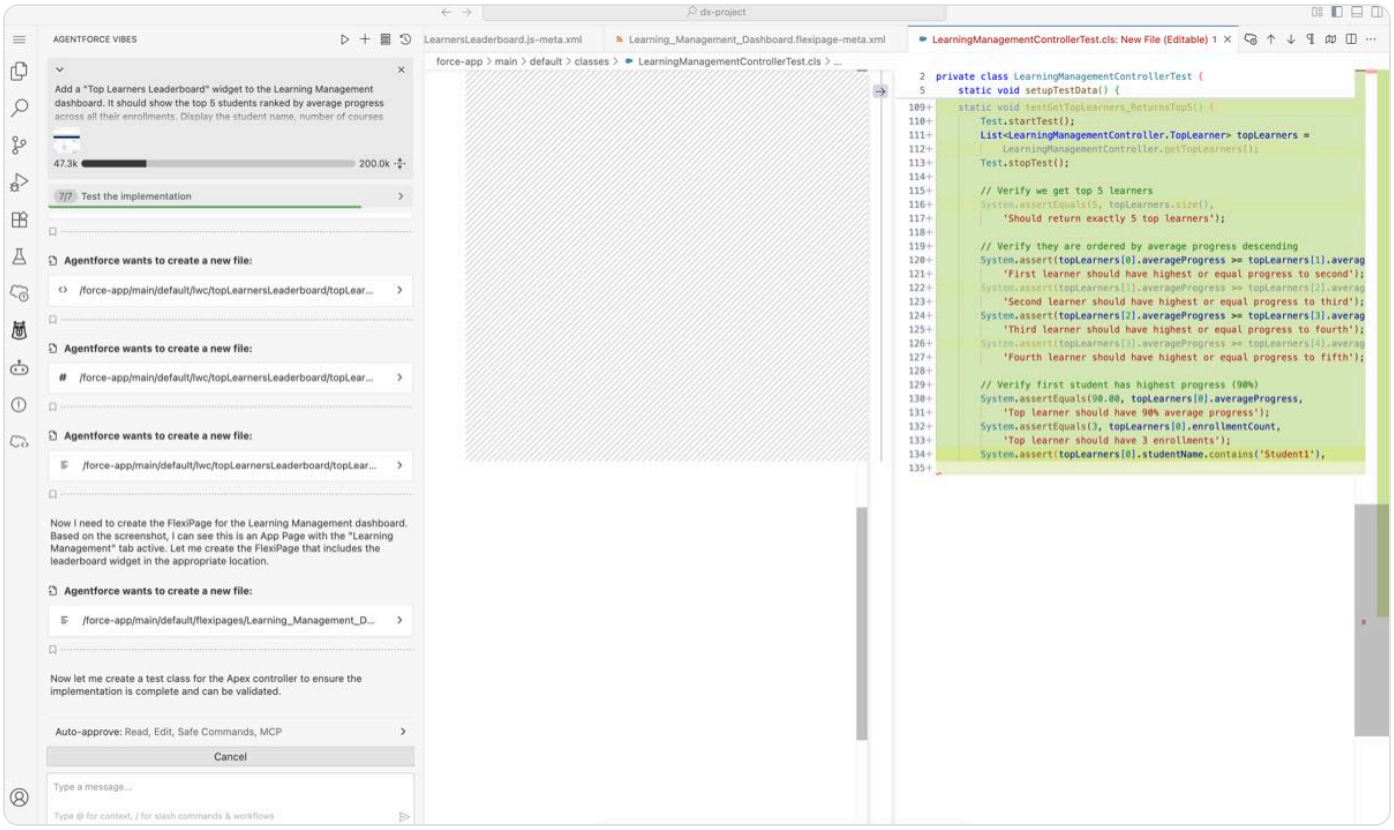

Agentforce Vibes first retrieves the existing LWC and Apex controller from your org, then reads your org metadata through the MCP servers and starts building. Notice how it identifies issues along the way and fixes them automatically. You'll see it:

- **Retrieve** the existing `learningManagementDashboard` LWC and `LearningManagementController` Apex class
- **Update the Apex controller** — add a new method to query top learners
- **Update the LWC** — add the leaderboard widget to the existing dashboard HTML, JS, and CSS

> **Approve requests to proceed**
>
> Agentforce Vibes will ask for permission before editing or creating each file. You can approve each request to let it proceed.

Agent & App Development Workshop

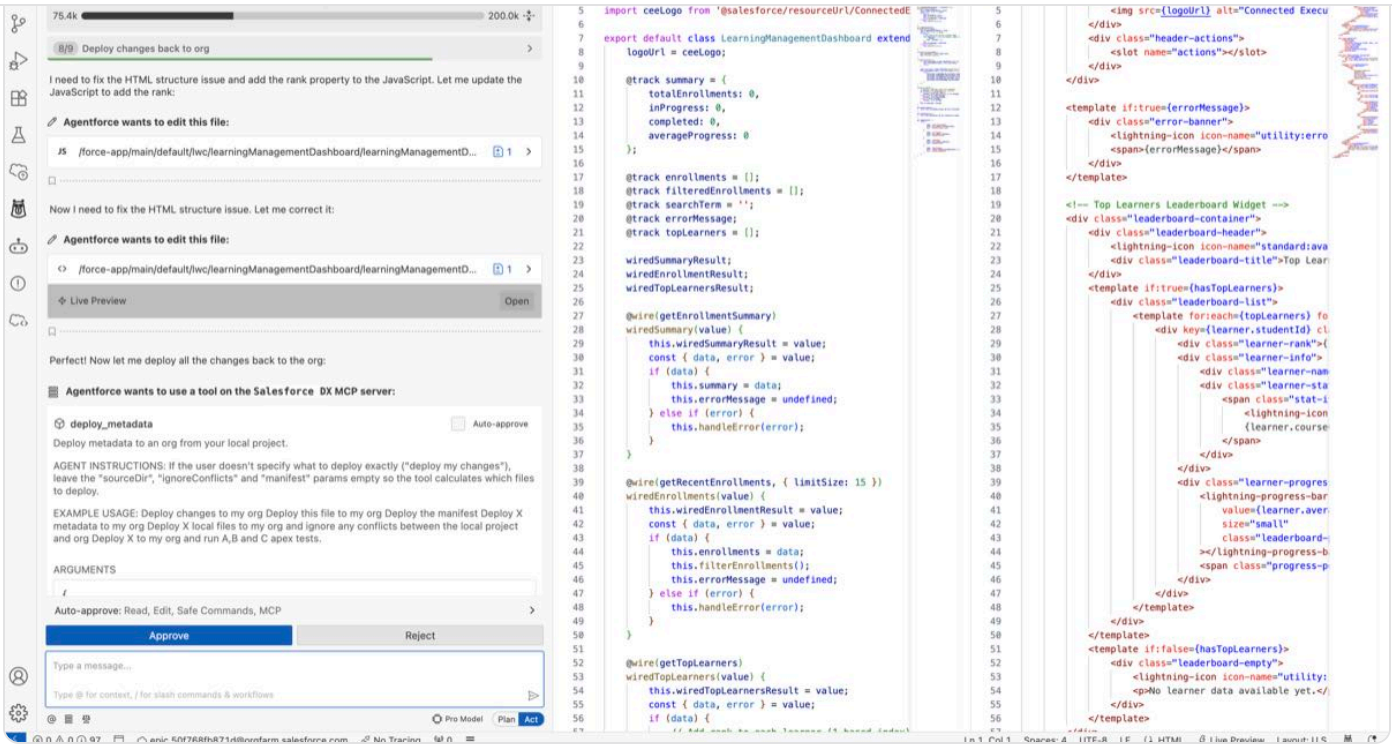

`LearningManagementControllerTest.cls` — with comprehensive test coverage for the new Apex method, including assertions for ranking, data validation, and edge cases.

4. Deploy to sandbox

Once all tasks are complete, Agentforce Vibes will deploy the changes back to your org. You'll see it use the `deploy_metadata` tool on the Salesforce DX MCP server. Approve the request to proceed.

Preview the component

5. Open Lightning Preview

Open the `learningManagementDashboard.html` file from the Explorer. Then open the Command Palette with **Cmd+P** and select **Lightning Preview** to see a live preview of the dashboard with the new leaderboard widget.

Agent & App Development Workshop

What just happened

From a single natural language prompt and a screenshot, Agentforce Vibes retrieved the existing code, updated the Apex controller and LWC component, created a test class, and deployed everything — all grounded in your org's actual metadata.
