Agent & App Development Workshop

~2 hours

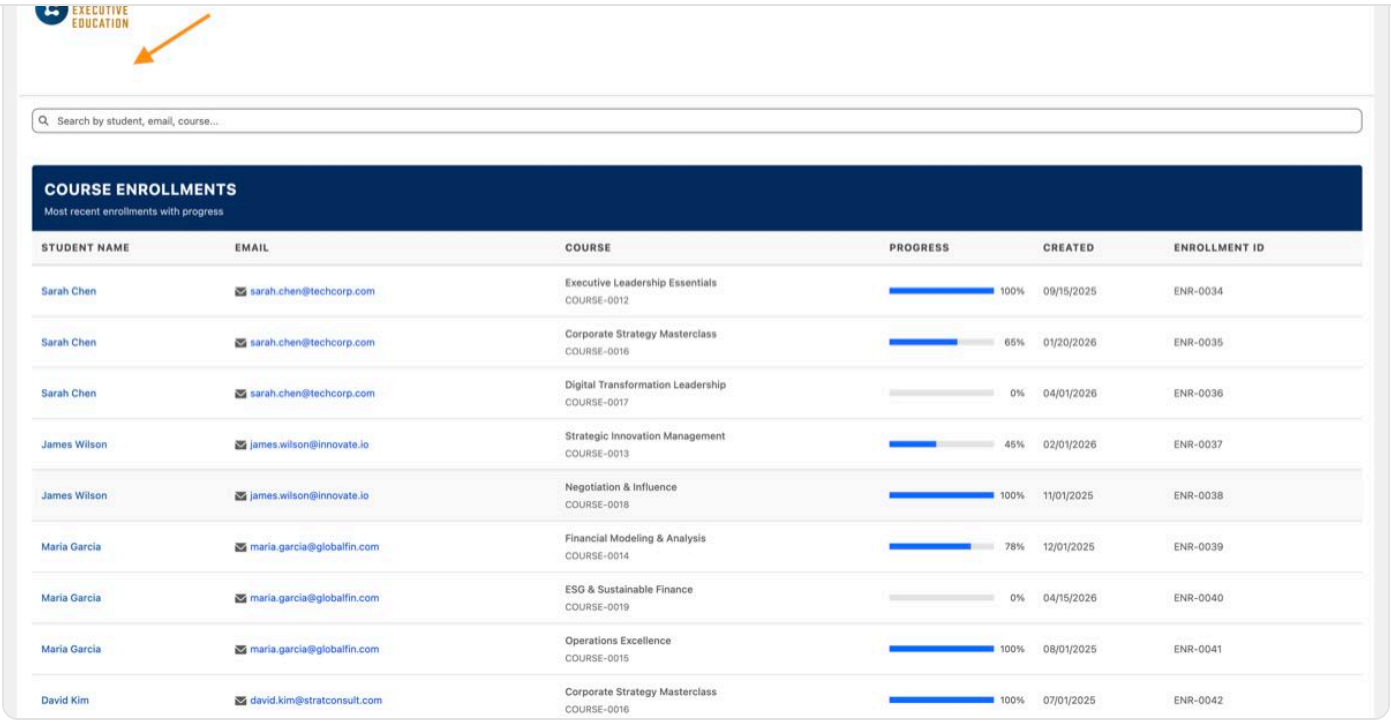

In this workshop, you'll walk two real development scenarios — a quick metadata change made entirely in the UI, and a full feature build using Agentforce Vibes. Both go through the same governed, sandbox-first pipeline to production.

The scenario

You're a developer on the team that manages the **Connected Executive Education** app. Two requests have come in from the business today:

1. Add a new **Deferred** enrollment status — students pausing to join a future cohort are being incorrectly marked as Withdrawn.
2. Add a **Top Learners Leaderboard** widget to the dashboard so program directors can see high performers at a glance.

Agent & App Development Workshop

The three development paths

There are 3 agent & application development paths. This workshop covers **two of them**:

The Solo Admin Path

For solo admins and small hybrid teams making surgical updates — UI copy tweaks, field changes, and quick config fixes.

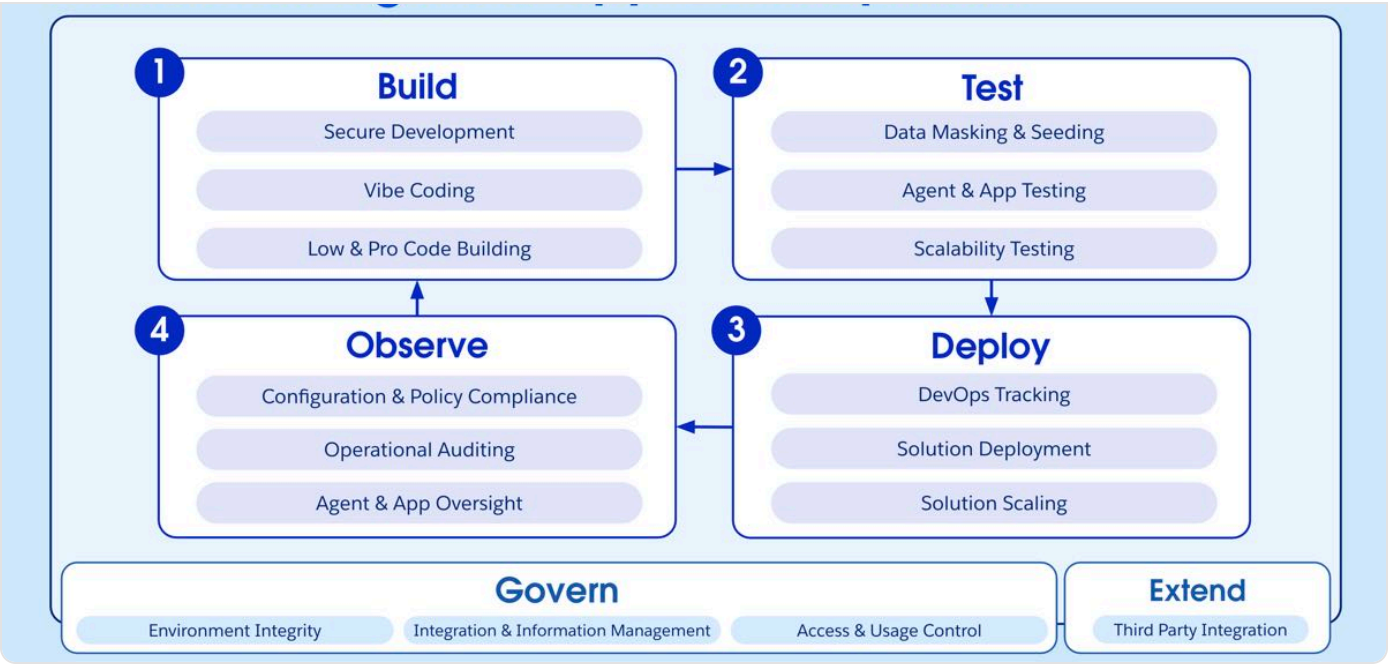

The Team Path

For small hybrid teams, multiple teams, and enterprise teams building large-scale features. Source-tracked development with built-in change management and release pipelines.

The AI-Accelerated Path

For multiple teams and enterprise teams building complex, high-quality features using natural language. AI-accelerated development workflows.

Agent & App Development Workshop

Before the session

PRE **Setup** — Sign up for your workshop org, log into the fullcopy sandbox, and enable Change Management — Before the session

Workshop agenda

USE CASE 1 — SOLO ADMIN PATH

1 **Add the Deferred Status** — Add a new picklist value to the Enrollment Status field directly in Setup, no code required — 12 min

2 **Promote to Production** — Use DX Inspector to review the diff and promote the field change from sandbox to production — 10 min

USE CASE 2 — AI-ACCELERATED PATH

Agent & App Development Workshop

4	**Agentforce Vibes Walkthrough** — Launch Agentforce Vibes and get oriented with MCP servers, skills, rules, and the Metadata Explorer	8 min
5	**Build the Leaderboard** — Write a natural language prompt and let Agentforce Vibes generate the Apex and LWC code for the Top Learners widget	7 min
6	**Verify** — Open your sandbox and confirm the Top Learners widget appears on the dashboard	5 min
7	**Promote to Production** — Open DX Inspector to review changed files, then promote from sandbox to production	5 min
